

1. In this array called hello

```
4 5 6 9 10
1 11 15 22 12
8 33 67 16 2
```

What does `hello[3][2]` print out?

2. How do you create a 4x4 2D array where every element is equal to the word the user enters as input?

3. Reassign a random element in your (above) 2D array to another word. Ask the user what they would like the word to be. (This is a continuation of the array from #2).
